3D Illustrated Conceptual Renderings

Stylized Realistic Illustration

This illustration style is complementary to the linear/iconography style. It is used when more complex illustrations are required to visually convey ideas. The overall style is realistic but not photographic.

Object Details

- Illustration elements are three-dimensional, using two or three-point perspective.
- Shapes are rendered using minimal gradients and cast shadows. Highlights, shadows, and mid-tones should blend smoothly, creating distinct tones. However, there should be no abrupt transitions from light to dark.
- Overall colorization should be minimal and colors should be muted.
- Elements should not be outlined.
- Individual elements should be illustrated from a 30-degree angle when possible to allow individual elements to be combined into more complex illustrations.

Figure Details

- Figure should be rendered with realistic proportions (no exaggerated, idealistic or stereotypical features).
- Lighting should be from a three-quarter angle, illuminating the front and one side of the figure.
- Total number of colors used should be limited and they should be muted, but slightly brighter than those used for physical objects.
- Faces should be rendered and lit to show dimensionality, rather than flat shapes.
- Clothing should be simple, with no distracting patterns or unnecessary details.

Technical Details

- The illustrations should be created in Adobe Photoshop or 3D application etc. They should be rendered at 300 dpi, and the largest dimension (width or height) should be approximately 24".
